

A skill that writes like you

about 30 minutes

By the end you have a skill that writes in your voice, and a piece it wrote that you'd send under your own name.

1. GATHER, IF YOU CAN

The interview is the lab; samples make it sharper. If you have two or three things you wrote yourself and were happy with (an email, a post, a report, a message), have them open. A recording or transcript of yourself talking is better still. If you have none of that, skip to step 2: the questions are enough.

2. INTERVIEW

In the desktop app, open the Code screen and start a new session in any folder (your Desktop is fine; the skill goes into your own Claude folder, not this one). Type:

```
I want a skill that writes in my voice. Interview me first, one question at a time: how I write, what I never say, who I usually write for, how formal I am, how long I run. If I have samples of my writing or a transcript of me talking, ask for them and use them; if I don't, work from the interview. Then write the skill to ~/.claude/skills/my-voice/SKILL.md, with a description that makes it load whenever I ask for something written in my voice.
```

Answer its questions in your own words; paste samples if you have them. Read the SKILL.md it writes. Strike anything you wouldn't say yourself.

3. A NEW SESSION

Start a new session (the + at the top of the Code sidebar). Claude only sees a new skill from the next session on.

4. USE IT

```
In my voice, write a short note to a customer explaining that the site survey found more access points than the design needs.
```

Read it. If it doesn't sound like you, say what's wrong, let it fix the skill, and ask again.

5. CHECK

Open grammarly.com/ai-detector in your browser (free, no account needed) and paste the note in. If it flags the writing as AI, tell Claude what it flagged and have it change the skill, not just

the note. Ask for the note again and check again.

YOU'RE DONE WHEN

- A note written by the skill sounds like you.
- The same note passes Grammarly's AI check.
