

What a plugin costs

about 15 minutes

Add a plugin, see what it did to your window, take it out again.

1. BEFORE

Start a new session in any folder and type `/context`. Note two numbers: how much of the window is used before you've typed anything, and how many skills are listed.

2. ADD ONE

Open the Plugins panel: type `/plugin` and press return. Along the top are two tabs, **Yours** (what you have) and **Discover** (what you can add). Go to Discover. The list mixes plugins, connectors and extensions; you want a **Plugin**, and a full one. Azure DevKit is a good choice (Bicep, AKS, App Service, Functions and more); otherwise pick any plugin that sounds like it carries a lot. Click **Add**.

3. AFTER

Start a new session and type `/context` again. Same two numbers. The difference is what the plugin costs you before you've typed a word, every session. Then open the Plugins panel, Yours, and click into the plugin to see what came in: the skills, the agents, anything else. Count what you'd use.

4. REMOVE

On the Yours tab, select the plugin and remove it. If you can't find how, ask Claude: "remove the Azure DevKit plugin". Start a new session, `/context` once more, and check the numbers are back where they started.

YOU'RE DONE WHEN

- You can say what the plugin cost your window before you'd typed a word.
- It's gone, and `/context` proves it.
